**Lessons from the Past: High-Risk Pools Will Not Help People in Georgia with Pre-existing Conditions Like HIV/AIDS**

### High-Risk Pools at a Glance

- Number of People Enrolled in 2011: 262,000 (out of 56 million Americans with pre-existing conditions that could cause them to lose or be denied coverage)
- Average Cost per Enrollee: $6,000–14,000 per year
- Waiting period for coverage of pre-existing conditions: 6–12 months
- Premium Cost Compared to the Average Premium in Private Health Plans: 125–200%
- Maximum lifetime expenses covered: $1–3 million

### What are High-Risk Pools?

High-risk pools are special insurance plans for people who cannot get or afford private health insurance because of a pre-existing condition. High-risk pools are set up and run by states. Before Congress passed the Affordable Care Act (ACA), 35 states had high-risk pools. Although they can greatly help people who cannot get insurance anywhere else, they were very expensive and covered very few people.

### Problems with State High-Risk Pools

Almost all Republican plans to replace the ACA, including the AHCA, would likely depend on high-risk pools to cover many people with pre-existing conditions. But high-risk pools are nothing new, and state pools that existed before the ACA had many problems. Because of those problems, they were only available and affordable for a tiny fraction of people with pre-existing conditions. A federal high-risk pool, the Pre-existing Condition Insurance Plan (“PCIP”) was created by the ACA to provide a bridge to new insurance marketplaces. It was more affordable than many state high-risk pools, but still had low enrollment. Even so, it ran out of money before its planned ending date. Although Georgia never ran a high-risk pool, the experiences of the states that did show that they had many problems. Below we explain problems that made state high-risk pools unavailable and ineffective for people with pre-existing conditions like HIV.

#### 1. Underfunding and High Costs

In the years before Congress passed the ACA, many states underfunded their high-risk pools. As a result, many of those pools were forced to freeze people out from enrolling or create waitlists because they did not have enough money to cover all the eligible people who wanted to sign up. These funding problems arose largely because high-risk pools were very expensive to operate. They only covered people with health problems that require expensive treatments and medicines. For example, one nationwide study found that high-risk pools cost around $6,000 per person in 2011. Another study found that it would cost $178 billion per year to properly fund high-risk pools in all 50 states that would adequately cover people with pre-existing conditions.
2. Limited Enrollment and Long Wait Times

Largely because of their high costs and limited budgets, high-risk pools enrolled only a tiny fraction of people with pre-existing conditions, restricting eligibility to certain medical conditions and often imposing waiting periods. As a result of these problems, even the largest state high-risk pools insured only a tiny fraction of their states' populations. Nationwide, just over 225,000 people—0.0007% of America's population in 2011—were enrolled in high-risk pools at their enrollment peak before the ACA was passed. Yet one in three non-elderly adults in the U.S.—about 56 million people—have pre-existing conditions that could interfere with their ability to afford and maintain private health insurance. In fact, one government study found that private insurers denied coverage to 19 percent of people who applied because of pre-existing conditions in the years before the ACA took effect. In Georgia alone, over 1.8 million people—or 29% of all non-elderly adults—could face barriers in affording and maintaining private insurance due to pre-existing conditions.

3. Unaffordable Premiums and Deductibles

For many people, high-risk pools were not affordable. Many people were forced to leave or discouraged from enrolling in high-risk pools because plans in those pools charged high premiums and deductibles. For example, in South Carolina's high-risk pool, the average premium for a 45-year-old person was around $1,100 per month. Even assuming that premiums would stay at 2017 prices, a single person with income at 150% of the current federal poverty level ($18,090 per year) would have to spend 73% of their gross income just on premiums in South Carolina's pool. That percentage also does not include any cost sharing or high-risk pools' high deductibles. For example, plans in Mississippi's high-risk pool had deductibles of $3,000 on average. And, unlike the ACA, most high-risk pools did not provide any subsidies to help with the high costs of their plans. As a result, high-risk pools nationwide mostly attracted higher-income people who could afford those high costs.
